PREFACE TO THIRD EDITION.

The success achieved by the previous editions of this work encouraged the author to undertake its extension to 100 feet. The extended part has, however, been tabulated by steps of $\frac{1}{16}$ " instead of $\frac{1}{32}$ " as the latter for lengths of over 50 feet would have little value, if any.

The computation and checking of the extended part has been carried out in the same careful manner as the old tables and it is therefore believed that it is as accurate as the old tables proved to be.

The parallel system of tabulation, visa the placing of the squares and logs of the same numbers opposite each other, has been retained, this arrangement offering a number of advantages, namely: (1) The square and the log of a number are often needed at the same time. (2) In many calculations the square of a number is given and its log required or vice versa, the number itself being of no use to the calculator; the parallel arrangement of the tables enables in such cases the reading of the log directly from its square or vice versa. (3) The log of the square can be obtained by multiplying its corresponding log item by 2.

In an article by Mr. F. D. Davis entitled; "Smoley's Tables; Some Convenient Methods by Their Use," published in the Engineering News of Dec. 25, 1902, Mr. Davis is discussing this special feature of these tables (visa their parallel arrangement) demonstrating the usefulness resulting from it by applying the tables to a number of examples relating mainly to mensuration. But in the opinion of the writer the parallel combination of the tables finds its most effective field of application in the solution of triangles for the purpose of figuring the data required for structural detail drawings. The most general problem we have here to deal with is this: With two given sides of a right-angle triangle, usually the main dimensions of the frame (as in a roof truss the half span and rise), to find: 1, the hypothenuse; 2, the bevel or slope; 3, the log, functions of the angles of the triangle, the latter for the purpose of figuring the diagonals of the frame, etc. Not only does the parallel combination of the tables enable the figuring of these three data in one process of calculation, but they are mutually checking

...

each other at the same time. In examples VI and VIII, pages 328 and 330, the hypothenuse, bevel, log tang. (visa the log. of the bevel) and log. sec. are obtained, the log. of any other function can be figured in the same manner as the log sec.

The Parallel combination of the logs. and squares is thus dispensing with the use of trigonometrical tables for all ordinary work of the structural draftsman, limiting their use to the rare cases where angles are given or required expressed in degrees, minutes, etc. The Table of Angles and Log Functions corresponding to given bevels, inserted in this edition, will in many such cases answer the purpose. The uses to which this table can be applied are manifold; a few more typical are here mentioned:

- 1. It offers an exact and rapid solution of a right-angle triangle when given by the bevel and one of its sides. When the bevel is a derived quantity and consequently approximate, the solution is also approximate, but sufficiently exact for many practical considerations.
- 2. The bevel or slope can directly be read from the angle expressed in degrees, minutes, etc., or vice versa.
- 3. The bevel can be obtained from the hypothenuse and one of the sides of the triangle without first figuring the other side by means of the table of squares. A few numerical examples showing the application of this table will be found on pages 302 and 303.

In conclusion would note that formula

$$d = (a - \frac{1}{64 \times 12})^2 - a^2$$

given on page 326 is to be modified for the part from 50' to 100' by substituting in the denominator 32 instead of 64.

This also relates to the foot note on page 327, where $\frac{1}{32}''$ is to be substituted by $\frac{1}{10}''$.

CONSTANTINE SMOLEY.

673 N. CLAREMONT AVE. CHICAGO, ILL., MARCH, 1906.

PREFACE TO FIRST EDITION.

This work contains logarithms and squares of feet, inches and fractions thereof expressed in decimals of a foot and varying by 1/32 of an inch from zero to fifty feet. While this table of logarithms is published for the first time, there are already in use two tables of squares, one by Mr. Buchanan, and the other, a more recent work, by Mr. Hall, whose tables give squares varying by 1/16 of an inch, while the author's table enables the calculator to obtain results up to fifty feet in thirty-seconds of an inch without interpolation, which is a greater advantage than tables varying by 1/16 of an inch for lengths up to 100 feet. The number of cases where it is desirable to obtain results in thirty-seconds of an inch for the lengths less than fifty feet, by far exceed those cases where calculations are to be made with dimensions from 50 to 100 feet. In the latter cases the calculator can work with the dimensions divided by two and then by multiplying his results by two, still obtain them correct to 1/16 of an inch without interpolation. The distinctive feature of this work, however, is its new element—the table of logarithms. This opens up a wider field of application than the squares themselves, and the combination of both tables increases the value of each of them. It will be of special value to the structural draftsman, as the most frequent problems he has to deal with are handled by means of these tables with great saving of time and fewer chances of making errors, as can be seen from the examples shown at the end of this book.

One of the German philosophers has said that "Method is the soul of Philosophy," and it is equally true in a work of this kind that method gives value and insures reliability. As regards the table of squares, we give Mr. Buchanan full credit as pioneer in this field, but his method is primitive, and his work lacks accuracy, as has already been pointed out by Mr. Hall, whose method is entirely correct. But the author made use of a still different method, having the advantage over Mr. Hall's in being simpler, requiring less work, and making it easier to check. It is as follows:

Let a^2 be the *first* item in any column in our table of squares, a being equal to any whole number of feet plus a whole number of inches expressed in decimals of a foot; let, further, $b=\frac{1}{2}a^2$ in

decimals of a foot and n denote any whole number between 0 and 32.; any other item in the same column is then equal to $(a+n b)^2$, and the difference between any two consecutive items in that column can be expressed in the formula:

$$(a+nb)^2-[a+(n-1)b]^2=2ab+(2n-1)b^2.$$

Now, if a² is known, all the 32 items of the column can be obtained by consecutive additions to a^2 of the constant for that column, 2ab, and the 32 different values of $(2n-1)b^2$. As these latter 32 values are constant for all columns of the table of squares, we have figured them out, and printed them in rotation on blank forms, leaving between each two a space for the item itself, and at the top of every blank we have put its corresponding a². We also have put in the items for each 1/2". The value of 2ab having been written on a slip of paper we place it over a2 and add it with a2 and the first printed value of $(2n-1)b^2$ for n=1, and the first item is thus obtained; the slip is then moved down and added with the item just obtained and the second printed value of $(2n-1)b^2$ for n=2, and so on; only one addition being thus required to obtain an item, and after every 16 additions we have to obtain the item previously put in the blanks - that is, the top and the middle items. The latter we worked out in a manner similar to that just described, a denoting any whole number of feet : b=1/2" in decimals of a foot, and n-any whole number between 0 and 24. It needed to be figured only to 12 feet, as after that the decimals repeat themselves. After the blanks were filled out, we compared every second item with those of Mr. Hall's tables, only three errors having been found in the latter. In order to discover any self-balancing error in the odd items, another table was calculated for the odd items and compared with the first results. The computation has been carried out to 7 decimals and reduced to 4; the first four pages to 11 and reduced to 6 decimals.

The computation of the table of logs, is based upon the formula:

=Log
$$(12 \times 32 f + 32 i + t)$$
 -Log 384(2)
or=Log $(12 \times 32 f + 32 i + t)$ +Colog 384 (2a)

The log. of any item is thus equal to the log. of the number of 32nds contained in that item, *minus* the constant log. of the number 384 or *plus* its Colog. If N be this number of 32nds contained in any item, $(N=12\times32f+32i+t)$, the difference between the logs. of two consecutive items equals

$$d = \text{Log.} \frac{N+1}{384} - \text{Log.} \frac{N}{384} = \text{Log. (N+1)} - \text{Log. N}$$

This difference can easily be taken from a standard logarithmic table.

The top items of all columns having been determined by formulæ (1) and (1a), they and the difference d having been put on blanks printed for this purpose, the work was then carried on by means of consecutive additions of the differences, after every 32 additions having had a check in the first item of the next column. Independently of this we figured the table of logs. by the formula (2a) that is, by taking in rotation the logs. of all numbers from 1 to 19200 and adding to each log, the colog. of 384—and compared both results, and, finally, we used the formula (2) for checking the electroplates.

Vega's 7 decimal log, tables have been used, and the computation carried out to 7 decimals and reduced to 5. In all cases where the last two figures of the 7 decimal Log, are 50, reference has been made to the "U. S. Coast and Geodetic Survey's" 10 decimal Log, tables.

On the last pages of this book will be found some explanations and examples showing the use of these tables. The former are intended for those who are not familiar with the use of Log, tables.

CONSTANTINE SMOLEY.

TABLES OF ANGLES AND LOGARITHMIC **FUNCTIONS**

Corresponding to bevels or slopes given to a base of 12 inches.

The following table bearing the above title gives the amount and log. functions of the angle whose natural tang, is the bevel given to 12. The bevels are given in the table by the big top figures, and fractions in the left column of the page, and opposite each fraction are placed the respective log. functions and the amount of the angle in degrees, minutes and seconds. The amount of the angle A, for instance, corresponding to the bevel of 43" to 12", (see accompanying figure).

can be read on page 308 as 20° 01′ 52", and the Log. functions of that

angle as Log Sine=9.53470, Log Cosec.=0.46530, etc.

If one of the sides of the right-angle triangle A B C and the slope of the hypothenuse are given, the other two sides can be figured by means of the well-known relations.

> b=c cosine A=a cotg A $c=b \sec A = a \csc A$ a=b tang. A =c sine A

hence Log b = Log. c + Log cosine A = Log a + Log cotg ALog. c = Log. b + Log. sec A = Log a + Log cosec. A

Log. a = Log. b + Log tang A = Log c + Log sine A

Let, for example, $s=4\frac{3}{8}$ and b=26 7\frac{3}{4}", then

Log. c=Log. b+Log sec. A and Log. a=Log. b+Log tang A

In our case, Log. b = Log. 26' 73'' = 1.42563

Log sec. A =0.02710

Log c=1.45273=Log 28' 411"

Log b=1.42563Log tang. A =9.56180

 $0.98743 = \text{Log. } 9' \ 8_{16}^{9}$ nearly Log a

The parallel arrangement of the tables of Logs, and Squares can here be taken advantage of for checking the values of a and c; namely: when taking from the table the Log. b, take at the same time its square, which, in our case, is 710.0004. In similar manner, while taking from the table the values of c and a, get also their squares, which in our example are respectively $a^2 = 94.3529$ and $c^2 = 804.4019$, then the relation of $a^2 + b^2 = c^2$ will show if a and c were figured correctly.

In our example, we have $a^2=94.3529 \\ b^2=710.0004 \\ c^2=804.3533=(28'4\frac{1}{6}\frac{1}{2})^2 \text{ nearly}$

EXPLANATIONS AND EXAMPLES.

The use of the Log. tables is based upon the following four properties of logarithms:

(1) The Log. of the product of any number of factors is equal to the sum of the Logs. of these factors. Accordingly, multiplication can be effected by adding the Logs. of the given factors and finding the number whose Log. is equal to that of the sum obtained.

Example: To multiply $7 \times 15 \times 8$.

On page 317 Log. 7=0.84510 Log. 15=1.17609 Log. 8=0.90309

Sum =2.92428

The number having this Log. is 840 (page 320).

(2) The Log. of any quotient is equal to the Log. of the dividend, minus the Log. of the divisor. Division can thus be made by subtracting the Log. of the divisor from that of the dividend, and finding the number whose Log. is equal to that of the difference obtained.

Example: To find $x = \frac{35 \times 27}{45}$; l.og. x = Log. 35 + Log. 27 - Log. 45.

Log. 35=1.54407 Log. 27=1.43136

Log. of Dividend=2.97543 Log. 45=1.65321

Log. x=1.32222=Log. 21.

(3) The Log. of any power of a number is equal to the Log. of the number multiplied by the exponent of the power.

For instance Log. 25²=2 Log. 25

Log. 25 = 1.39794 $Log. 25^2 = 2.79588 = Log. 625$

(4) The Log. of the root of any number is equal to the Log. of the number, divided by the index of the root.

For instance, $\log \sqrt{529} = \frac{1}{2} \log_{0.529}$ $\log \frac{529}{2.72346}$ $\log \sqrt{529} = 1.36173 = \log_{0.23}$ In performing additions and subtractions of Logs. it is necessary to take into consideration the fact that the Logs. of numbers less than 1 are negative, but for the sake of convenience, they are turned into positive expressions by increasing them by 10 units. For instance, the Log. of $0.3\%_{32}$ is given in the table as 9.42851; its true Log. equals 9.42851-10, and so is the Log. of every item from 0 to 1.0%. Therefore, (1) when adding Logs. if the sum obtained is more than 10 units, decrease it by 10.*) For instance, to find $x=5\times0.7\%$ 6.

(2) when making divisions if the Log. of the divisor is greater than that of the dividend, add to the Log. of the dividend 10 units. Example: To find x=46' 10"÷64

Log x=Log 46'10"-Log 64 Log 46'10"=1.67056 Log 64 =1.80618 Log x =9.86438=Log 0'825/32"

SOME PRACTICAL EXAMPLES.

EXAMPLE I.

To find the circumference c of a circle whose dia. d=7'3%''

 $c = \pi d$; Log $c = \text{Log } \pi + \text{Log } d$.

On page 323: Log 71=0.49715 On page 30: Log d=0.86407

Log c = 1.36122

The number whose Log. is the nearest to this is 22'1111/16' (page 92) which is the required circumference.

EXAMPLE II.

In the right-triangle A B C (Figure 2) given B C=7'95''; A C=13'73''' and A E=7'41''' to find D E parallel to B C

$$D = \frac{BC \times AE}{AC};$$

Log D E=Log B C+Log A E-Log A C Log B C=0.89221 Log A E=0.86776

Sum=1.75997

Log A C=1.13500Log D E=0.62497

The number having the nearest Log. is 4'21%2" (Page 17).

^{*)} A number whose true Log. is more than 10 units, exceeds 10 billions.

EXAMPLE III.

To find the area A of a circle whose radius $r=15'8\frac{1}{2}''$.

Let a be the side of a square having the same area as the circle, then $A=\pi r^2=a^2$; $a=r\sqrt{\pi}$.

To obtain a2, find the Log. of a and the square corresponding to the Log. nearest to that found.

> $\text{Log } a = \text{Log } r + \text{Log } \sqrt{\pi}.$ On page 63: $\log r = 1.19613$ On page 323: $\log \sqrt{\pi} = 0.24857$ Log a = 1.44470

The nearest square will be found on page 112 to be=775.1294. which is the required area in square feet.

As the absolute difference between the true area and the one obtained can never exceed $d=(a-\frac{1}{64\times 12})^2-a^2$, the result is near enough for all practical considerations.

EXAMPLE IV.

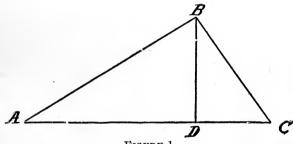

FIGURE 1.

Given the three sides of the triangle A B C, to find A D and D C BD being the height of the triangle.

Let A B=c; A C=b; B C=a; A D=m and D C=n, then

$$m = \frac{c^2 + b^2 - a^2}{2b} \text{ and}$$

$$n = \frac{a^2 + b^2 - c^2}{2b}$$

By the table of squares find $c^2+b^2-a^2=w^2$ and $a^2+b^2-c^2=w^2$

then
$$m = \frac{w^2}{2b}$$
; $n = \frac{v^2}{2b}$

Log
$$m=2$$
 Log $w-(\text{Log } 2+\text{Log } b)$
Log $n=2$ Log $w-(\text{Log } 2+\text{Log } b)$

Find the Logs. corresponding to the nearest w^2 and v^2 multiply these Logs. by 2, subtract from the product the Logs. of 2 and b, the differences will be the Logs. of m and n, by which m and n themselves can be obtained as in example 1.

EXAMPLE V.

In the right-triangle A B C (Figure 2) given B C=3'11'5'6'', A C=8'10\%'', to find the hypotenuse A B

A B²=A C²+B C² B C²=15.9584 A C²=78.5808 Sum=94.5392=A B²

The nearest square=94.5554 (Page 39) and the root= $9'81\frac{1}{16}$ ".

Should the hypotenuse A B and one of the sides, say A C, be given and the other side BC required, subtract A C² from A B²; the difference will be equal to the square of B C, and the nearest root is then found as in the case above.

Let these errors be denoted respectively by e_m and e_n , and let h_w and h_v be the differences between the true values of w and v and the values whose Logs. are the nearest corresponding in the table to w^2 and v^2 ; then by Taylor's theorem:

$$e_{m}=f(w+h_{w})-f(w)=$$

$$=f'(w) h_{w}+f''(h_{w}) \frac{h_{w}}{2!}+f'''(w) \frac{h_{w}}{3!}+\dots =$$

$$=\frac{wh_{w}}{b}+\frac{h_{w}}{b}. \text{ As } h_{w} \text{ is less than } \frac{1}{64}''$$
the value of $\frac{h_{w}}{b}$ can be neglected and $e_{m}=\frac{wh_{w}}{b}.$
As $w^{2}=2bm$ and $2b>m$

$$\text{consequently } w<2b$$

$$\text{or } \frac{w}{b}<2$$

$$\text{and } \frac{wh_{w}}{b}<2h_{w} \text{ or } e_{m}<2h_{w}$$
As $h_{w}<\frac{1}{64}''$, $e_{m}<2h_{w}<\frac{1}{32}''$; and by similar.

reasoning it can be shown that en <1/32"

^{*} The error in the values of m and n resulting from substituting these Logs. for the Logs. of w and v is less than $\frac{1}{32}$. This can be proven as follows:

EXAMPLE VI.

In the preceding example required the bevel b

$$\frac{b}{1} = \frac{BC}{AC}; b = \frac{BC}{AC};$$

$$Log b = Log. BC - Log. AC$$

Log B C=0.60149Log A C=0.94766Log $b=\overline{9.65383}$

The nearest Log. is 9.65371 (Page 2), and the number having this Log. equals= $51\%_2$, which will be the required bevel.

Should b=12'' and the bevel parallel to AC be required, subtract the Log. of BC from the Log. of AC, and find the nearest number as in preceding case.

It will frequently occur that B C and A C will be given, and both the hypotenuse A B and the bevel b will be required in the same time. In this case, firstly, time can be saved by taking out from the tables at once the Logs. and the Squares of the given sides; secondly, the correctness of both the obtained length of the hypotenuse and that of the bevel can be checked in the following manner: When getting A B by its Square, take out also from the table its Log.; subtract from the latter the Log. of Ac; the difference will be equal to the Log. of Sec A, as

Sec $A = \frac{A B}{A C}$, and LogSec A = Log A B - Log A C. The number

corresponding to this Log. is then easily found; but as Sec ${}^{2}A=1+b^{2}$, when getting b by its Log. take also its Square and add to it 1; the sum will be equal to Sec ${}^{2}A$, and the corresponding root is again easily obtained. Both values of Sec A, thus obtained, must be equal to each other within $\frac{1}{2}$ if the work is done correctly.

In the numerical examples V and VI:

Log AB=0.98784 Log AC=0.94766 Log Sec A=0.04018

The nearest number=1/15/32"

 $b^2 = 0.2030$ $1 + b^2 = 1.2030$

and the nearest root=1'15/32".

EXAMPLE VII.

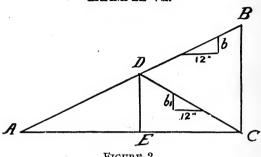

FIGURE 2.

In the structural frame ADBCE given AE, EC and BC to find AB, AD, DB, DE, DC and the bevels b and b_1 .

From the tables take the Logs, and the Squares of the given dimensions, AC, BC, AE and EC, find AB and its Log., b and its Square as in preceding examples. DE is then found by formula given in example II:

$$D = \frac{AE \times BC}{AC} = A \times b$$

Log. DE=Log. AE+Log b

rom which D E and its square are obtained. D C and b_1 are then found from the \triangleright D E C, as in examples V and VI, and A D from the \triangleright A D E.

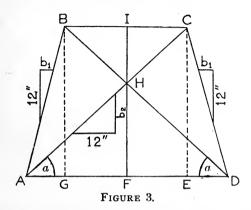

A D and D B can also be figured by the following formulas:

A D=A E Sec A=
$$\frac{AE \times AB}{AC}$$
D B=E C Sec A= $\frac{EC \times AB}{AC}$

These formulas and those given in example IV can be used for checking the dimensions obtained.

EXAMPLE VIII.

In the tower frame A B C D (Figure 3) given

B C, the height C E=h and the bevel bI, to find AB, AD, AC, AH, HC, FH and IH.

NOTE—In working out this and similar problems the use of the schedule on the next page will result in considerable saving of time and enable the rapid checking of the derived quantities. In it N stands for Number, L for Logarithms, and S for Square. These three columns are to be filled out gradually, each line of figures by a single

reference to the "Parallel Tables."

We begin with the solution of the triangle ABG, which is carried out in the same manner as the solution of the example on page 302, whereby the values of AG and AB are checked at the same time, thus preventing the carrying over of errors in the further calculations. Next we go over to the solution of the triangle A C E. In this triangle we need \vec{b}_{a} , AC, Log. tang. a and Log. sec. a. If we proceed in the same way as indicated on page 328, having already in our schedule-table the Log. and Square of CE, we take from the "Parallel Tables" the Log. and Square of A E, add the squares and subtract log. C E from 10g. A E; the first result gives AC2, and the second result, log. tang. $a = \log b_2$. Referring back to the "Parallel Tables," we take from it b_2 and b_2^2 and AC and log. AC, subtract log. AE from log. AC, the difference equals log. Another reference to the table will give us sec. 2a, which equals $1+tg^2$ $a=1+b_2^2$, which relation will show if all the three data required were figured correctly. If this is the case we go over to the solution of the triangle AHF, in which

A H=A F sec. a and H F=A F tg a

Hence Log. A H=Log. A F+Log. sec. a

and log H F = log A F + log tg aSimilarly, log H C = log I C + log sec. aand log H I = log I C + log tang. a

The checking of the latter dimensions can be done by means of the simple relations of A H+H C=A C and I H+H F=h.

The schedule below shows the results carried out for the numerical values of b_1 ,= $1\frac{\pi}{5}$ ", B C= $24'6\frac{1}{2}$, and $h=25'5\frac{3}{4}$ ".
